## EDUCATION

**B.S. in Software Engineering (Cohort K20)**

FPT University Hanoi — 2024 - 2028

- Term 4/9 (Preparing for 2026 OJT Internship)
- Core foundations: C#, OOP, Data Structures & Algorithms

## CODE REPOSITORIES

GITHUB

| AOG Remake: | AOGremake |
| Club Team Game: | team6-game |

## HONORS & AWARDS

- **2-Time Honor Student (Terms 1 & 2)**
  FPT University – Recognized for consecutive top academic performance in Software Engineering core courses.
- **Excellence in C# & OOP Software Design**
  Strong grasp of algorithm optimization, design patterns, and clean code principles.

## ACTIVITIES & CLUB

**Technical Dept. – JS Club (FPTU)** — Term 4 - Present

Selected for the Technical Department of JS Club at the start of Term 4; actively engineered team game projects and researched Unity/C# workflows.

## LANGUAGES

**English:** Proficient in reading complex technical documentation, Unity API docs, RFC WebSockets, and international developer forums.

# BUI QUANG CUONG

## UNITY GAME DEVELOPER INTERN

Cohort K20 • Available for OJT 2026

## PROFESSIONAL SUMMARY

Dedicated Software Engineering student (Cohort K20, FPT University) with a strong passion for bringing virtual game worlds to life through responsive controls, smooth gameplay feel, and clean modular code. Grounded in C#, OOP principles, Unity 2D architecture, and real-time Client-Server networking.

- **Short-term Goal (3-6 months):** Actively contribute to commercial production during the OJT internship, adapt smoothly to studio pipelines, and master core gameplay logic, network sync, and UI modules.
- **Long-term Goal (1-3 years):** Advance into an autonomous Unity Game Developer, mastering deep engine optimization (Zero GC), scalable software architectures, and compelling combat feel.

## TECHNICAL SKILLS

**Languages & Engine:** **C#** (Proficient in OOP, LINQ, Action/Func Events, Async/Await), C/C++, Java basics; Unity 2D (Physics 2D, UGUI Canvas, Animation, Particle Systems, ScriptableObjects, Tilemap).

**Architecture & Optimization:** **Object Pooling** (Zero GC allocation), **Finite State Machines (FSM)**, Event-Driven Architecture, Component-based Design, Singleton pattern.

**Networking & Backend:** **Client-Server Architecture**, WebSockets, Standalone Game Server in **.NET Core C#**, Room management & low-latency real-time state synchronization.

**Tools & Workflow:** Git/GitHub (Branching, PRs, Merge Conflict Resolution), Visual Studio, Unity Editor 2022/2023 LTS, Trello/Jira, proactive communication (Ho-Ren-So).

## FEATURED GAME PROJECTS

2 Production-ready playable projects

### AOG (ARCHER OF GOD) – 1V1 REAL-TIME ONLINE DUEL GAME

3 Months (08/2026 – 11/2026)

**Role:** Full-stack Game Developer (Solo Project) — GitHub Repository

- **Custom Client-Server Architecture:** Engineered a dedicated standalone game server in **C# .NET Core** using WebSockets ( `AOG.Server` ); implemented room lifecycles ( `RoomManager` ), client sessions, and low-latency real-time state synchronization for 1v1 duels across LAN/Internet.
- **Dynamic Combat & Passive System:** Designed responsive archery shooting mechanics; built an extensible passive framework with **10+ unique bow passives** (Ice Shot freeze, Lifesteal, Double Shot, Magnet attraction, Shield Shot, Time Freeze, Trap Shot, etc.).
- **Tactical Skill Abilities:** Programmed dynamic combat skills including Healing Totems, Timed Bombs, Physics-based Rolling Boulders, and High-Energy Beam effects responding in real-time.
- **Zero-GC Memory Optimization:** Implemented high-performance **Object Pooling** ( `ArrowPool` , `EffectPool` ) for all arrows, abilities, and particle VFX, preventing garbage collection stutter and maintaining a rock-solid 60 FPS.
- **Deck-building Loadout & Meta UI:** Built an interactive Loadout UI allowing players to customize card decks (Bows & Active Skills) with dynamic stat recalculation, match countdown, dynamic arena BGM (Angel vs Devil), and SFX.

### MONSTERS SLAYER – 2D ACTION BEAT 'EM UP GAME (JS CLUB PROJECT)

4 Months (01/2026 – 04/2026)

**Role:** Core Gameplay Programmer (JS Club Technical Dept. Team Project) — GitHub Repository

- **Diverse Enemy AI Ecosystem:** Architected AI behaviors via **Finite State Machines (FSM)** for 6+ distinct enemy types (Axe Melee, Chainsaw Berserker, Flying Aerial Hunter, Jump Ambush, Rope Swinger, Guard Dog) with patrol, chase, and dynamic attack telegraphs.
- **Interactive Weapon & Combat Mechanics:** Programmed an interactive dropped-weapon mechanic ( `DropWeapon` , `FlyObject` ) allowing players to pick up, throw, or clash weapons; coupled with combo animations (uppercuts, air attacks, heavy smashes) for impactful combat feel.
- **Wave Spawner & Endless Mode:** Built the scalable wave progression manager ( `SpawnManager` , `WaveData` ) supporting both Campaign Progression and Endless Survival mode, along with an in-game dynamic dialogue bubble ( `ChatBox` ) and interactive tutorial overlay.
- **Event-Driven Systems & Team Git Workflow:** Leveraged **Event-Driven Architecture (C# Events)** to decouple health logic from UGUI; implemented custom object pooling ( `PoolThapCam` ) and standardized modular prefabs to eliminate merge conflicts.
